Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

: - BC Omni - April 19,2011 --- Vision Critical --- 5/9/2011 tl

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

Results are based on two-sided tests assuming equal variances with significance level 0.05. For each significant pair, the key of the smaller category appears under the category with larger mean.

Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Cell counts in some subtables are not integers. They were rounded to the nearest integers before performing pairwise comparisons.

1 - BC Omni - April 19, 2011 --- Vision Critical --- 5/9/2011 11

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

1 - BC Omni - April 19, 2011 --- Vision Critical --- 5/9/2011 11

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

- BC Omni - April 19, 2011 --- Vision Critical --- 5/9/2011 tl
 Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.
 Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.
 Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

- BC Omni - April 19, 2011 --- Vision Critical --- 5/9/2011 tt

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.

- BC Omni - April 19, 2011 --- Vision Critical --- 5/9/2011 tt

Results are based on two-sided tests with significance level 0.05. For each significant pair, the key of the category with the smaller column proportion appears under the category with the larger column proportion.

Tests are adjusted for all pairwise comparisons within a row of each innermost subtable using the Bonferroni correction.

Cell counts of some categories are not integers. They were rounded to the nearest integers before performing column proportions tests.
